RStudio

Integrated Development Environment

- Windows
- Mac
- Linux

RStudio

Composé de 4 fenêtres, qu'on peut redimensionner, masquer, ...

- Edition de fichiers sources (script R, ...)

- Console

- Affichage des objets, visualisation, ...

- un navigateur de fichiers
- une fenêtre d'affichage et d'export des graphiques
- une liste des packages (MàJ, installation)
- Aide

RStudio

The image shows the RStudio desktop application interface. It features a menu bar at the top (File, Edit, Code, View, Plots, Session, Build, Debug, Tools, Help), a toolbar with icons for file operations and running code, and a main workspace divided into four panels: Script, Environment, Console, and Files. The Script panel contains R code for loading libraries, reading Excel files, and creating boxplots. The Environment panel shows the current workspace with objects like 'fic', 'nomclim', 'bio1.lm', and 'fic.pca'. The Console panel displays the R startup message and a series of commands being executed. The Files panel shows a directory listing of the current project folder.

Script

```
1 library(readxl)
2 library(ade4)
3 library(car)
4 fic<-read_excel("climat.xlsx",sheet="climat")
5 nomclim<-read_excel("climat.xlsx",sheet="bioclim")
6
7
8 par(mfrow=c(1,2),las=3)
9 with(fic,boxplot(bio12~Pays))
10 title(main=nomclim[nomclim$Variable=="BIO12"],$Intitulé)
11
12 with(fic,boxplot(bio1~Pays))
13 title(main=nomclim[nomclim$Variable=="BIO1"],$Intitulé)
14
15 par(mfrow=c(2,2))
16 bio1.lm<-with(fic,lm(bio1~Longitude+Latitude+Pays))
```

Environment

Object	Class	Attributes
fic	data.frame	30 obs
nomclim	data.frame	19 obs
bio1.lm	lm	Linear model
colorname	character	chr
fic.pca	list	Principal Component Analysis

RStudio

The screenshot displays the RStudio environment with the following components:

- Script Editor:** Contains R code for loading libraries, reading data from Excel, and plotting boxplots of annual precipitation by country.
- Environment Pane:** Lists objects in the workspace: `fic` (30 obs. of 24 variables), `nomclim` (19 obs. of 24 variables), `bio1.lm` (List), `colorname` (chr), and `fic.pca` (List).
- Console:** Shows the R startup message and the execution of the script, including an error message: `Error in setwd(rstudio) : object 'rstudio' not found`.
- Boxplot:** Titled "Annual precipitation", showing the distribution of precipitation for seven countries: Algérie, Egypte, Espagne, France, Grèce, Italie, and Maroc. The y-axis ranges from 0 to 1400.

Overlaid text boxes highlight key features:

- Script:** Points to the source code editor.
- Liste des objets du workspace:** Points to the Environment pane.
- Console:** Points to the console output area.
- Graphique:** Points to the boxplot.

RStudio

The image shows the RStudio IDE interface. The top menu bar includes File, Edit, Code, View, Plots, Session, Build, Debug, Tools, and Help. The toolbar below the menu contains icons for file operations and running code. The main editor window displays a script with R code for reading Excel files and creating plots. The Environment pane on the right shows the global environment with objects like 'fic' and 'nomclim'. The Console pane at the bottom shows the R prompt and output. The Documentation pane on the right provides links to R resources, manuals, and reference materials.

Script

RStudio

The image shows the RStudio desktop environment. The main window is divided into four panes: Source (left), Environment (top right), Console (bottom left), and Packages (bottom right). The Source pane contains an R script with 16 lines of code. The Environment pane shows the current workspace with objects 'fic' and 'nomclim'. The Console pane shows the output of the script, including an error message. The Packages pane shows a list of installed and available packages. A 'Script' label points to the Source pane. A 'Liste des objets du workspace' label points to the Environment pane. A 'Packages à mettre à jour' label points to the Update Packages dialog box. A 'Console' label points to the Console pane. A 'Packages' label points to the Packages pane.

horizontal rule (or slide break):

## Syntax

Make a code chunk with three back ticks followed by an `r` in braces. End the chunk with three back ticks:

```
```{r}
paste("Hello", "World!")
```
```

Place code inline with a single back ticks. The first back tick must be followed by an `R`, like this ``r paste("Hello", "World!")``.

Add chunk options within braces. For example, ``echo=FALSE`` will prevent source code from being displayed:

```
```{r eval=TRUE, echo=FALSE}
paste("Hello", "World!")
```
```

## Becomes

Make a code chunk with three back ticks followed by an `r` in braces. End the chunk with three back ticks:

```
paste("Hello", "World!")
```

```
## [1] "Hello World!"
```

Place code inline with a single back ticks. The first back tick must be followed by an `R`, like this `Hello World!`.

Add chunk options within braces. For example, `echo=FALSE` will prevent source code from being displayed:

```
## [1] "Hello World!"
```

Learn more about chunk options at <http://yihui.name/knitr/options>

## Chunk options

| option                 | default value | description                                                                                                                                                                                                                                                                     |
|------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Code evaluation</b> |               |                                                                                                                                                                                                                                                                                 |
| <b>child</b>           | NULL          | A character vector of filenames. Knitr will knit the files and place them into the main document.                                                                                                                                                                               |
| <b>code</b>            | NULL          | Set to R code. Knitr will replace the code in the chunk with the code in the code option.                                                                                                                                                                                       |
| <b>engine</b>          | 'R'           | Knitr will evaluate the chunk in the named language, e.g. <code>engine = 'python'</code> . Run <code>names(knitr::knit_engines\$get())</code> to see supported languages.                                                                                                       |
| <b>eval</b>            | TRUE          | If FALSE, knitr will not run the code in the code chunk.                                                                                                                                                                                                                        |
| <b>include</b>         | TRUE          | If FALSE, knitr will run the chunk but not include the chunk in the final document.                                                                                                                                                                                             |
| <b>purl</b>            | TRUE          | If FALSE, knitr will not include the chunk when running <code>purl()</code> to extract the source code.                                                                                                                                                                         |
| <b>Results</b>         |               |                                                                                                                                                                                                                                                                                 |
| <b>collapse</b>        | FALSE         | If TRUE, knitr will collapse all the source and output blocks created by the chunk into a single block.                                                                                                                                                                         |
| <b>echo</b>            | TRUE          | If FALSE, knitr will not display the code in the code chunk above its results in the final document.                                                                                                                                                                            |
| <b>results</b>         | 'markup'      | If 'hide', knitr will not display the code's results in the final document. If 'hold', knitr will delay displaying all output pieces until the end of the chunk. If 'asis', knitr will pass through results without reformatting them (useful if results return raw HTML, etc.) |
| <b>error</b>           | TRUE          | If FALSE, knitr will not display any error messages generated by the code.                                                                                                                                                                                                      |
| <b>message</b>         | TRUE          | If FALSE, knitr will not display any messages generated by the code.                                                                                                                                                                                                            |
| <b>warning</b>         | TRUE          | If FALSE, knitr will not display any warning messages generated by the code.                                                                                                                                                                                                    |
| <b>Code Decoration</b> |               |                                                                                                                                                                                                                                                                                 |
| <b>comment</b>         | '###'         | A character string. Knitr will append the string to the start of each line of results in the final document.                                                                                                                                                                    |
| <b>highlight</b>       | TRUE          | If TRUE, knitr will highlight the source code in the final output.                                                                                                                                                                                                              |
| <b>prompt</b>          | FALSE         | If TRUE, knitr will add <code>&gt;</code> to the start of each line of code displayed in the final document.                                                                                                                                                                    |
| <b>strip.white</b>     | TRUE          | If TRUE, knitr will remove white spaces that appear at the beginning or end of a code chunk.                                                                                                                                                                                    |
| <b>tidy</b>            | FALSE         | If TRUE, knitr will tidy code chunks for display with the <code>tidy_source()</code> function in the <code>formatR</code> package.                                                                                                                                              |

# Chunk options

## Syntax

Make a code chunk with three back ticks followed by an `r` in braces. End the chunk with three back ticks:

```
```{r}
paste("Hello", "World!")
```
```

Place code inline with a single back ticks. The first back tick must be followed by an `R`, like this ``r paste("Hello", "World!")``.

Add chunk options within braces. For example, ``echo=FALSE`` will prevent source code from being displayed:

```
```{r eval=TRUE, echo=FALSE}
paste("Hello", "World!")
```
```

## Becomes

Make a code chunk with three back ticks followed by an `r` in braces. End the chunk with three back ticks:

```
paste("Hello", "World!")
```

```
## [1] "Hello World!"
```

Place code inline with a single back ticks. The first back tick must be followed by an `R`, like this `Hello World!`.

Add chunk options within braces. For example, `echo=FALSE` will prevent source code from being displayed:

```
## [1] "Hello World!"
```

Learn more about chunk options at <http://yihui.name/knitr/options>

## Chunk options

| option                 | default value | description                                                                                                                                                                                                                                                                     |
|------------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Code evaluation</b> |               |                                                                                                                                                                                                                                                                                 |
| <b>child</b>           | NULL          | A character vector of filenames. Knitr will knit the files and place them into the main document.                                                                                                                                                                               |
| <b>code</b>            | NULL          | Set to R code. Knitr will replace the code in the chunk with the code in the code option.                                                                                                                                                                                       |
| <b>engine</b>          | 'R'           | Knitr will evaluate the chunk in the named language, e.g. <code>engine = 'python'</code> . Run <code>names(knitr::knit_engines\$get())</code> to see supported languages.                                                                                                       |
| <b>eval</b>            | TRUE          | If FALSE, knitr will not run the code in the code chunk.                                                                                                                                                                                                                        |
| <b>include</b>         | TRUE          | If FALSE, knitr will run the chunk but not include the chunk in the final document.                                                                                                                                                                                             |
| <b>purl</b>            | TRUE          | If FALSE, knitr will not include the chunk when running <code>purl()</code> to extract the source code.                                                                                                                                                                         |
| <b>Results</b>         |               |                                                                                                                                                                                                                                                                                 |
| <b>collapse</b>        | FALSE         | If TRUE, knitr will collapse all the source and output blocks created by the chunk into a single block.                                                                                                                                                                         |
| <b>echo</b>            | TRUE          | If FALSE, knitr will not display the code in the code chunk above its results in the final document.                                                                                                                                                                            |
| <b>results</b>         | 'markup'      | If 'hide', knitr will not display the code's results in the final document. If 'hold', knitr will delay displaying all output pieces until the end of the chunk. If 'asis', knitr will pass through results without reformatting them (useful if results return raw HTML, etc.) |
| <b>error</b>           | TRUE          | If FALSE, knitr will not display any error messages generated by the code.                                                                                                                                                                                                      |
| <b>message</b>         | TRUE          | If FALSE, knitr will not display any messages generated by the code.                                                                                                                                                                                                            |
| <b>warning</b>         | TRUE          | If FALSE, knitr will not display any warning messages generated by the code.                                                                                                                                                                                                    |
| <b>Code Decoration</b> |               |                                                                                                                                                                                                                                                                                 |
| <b>comment</b>         | '###'         | A character string. Knitr will append the string to the start of each line of results in the final document.                                                                                                                                                                    |
| <b>highlight</b>       | TRUE          | If TRUE, knitr will highlight the source code in the final output.                                                                                                                                                                                                              |
| <b>prompt</b>          | FALSE         | If TRUE, knitr will add <code>&gt;</code> to the start of each line of code displayed in the final document.                                                                                                                                                                    |
| <b>strip.white</b>     | TRUE          | If TRUE, knitr will remove white spaces that appear at the beginning or end of a code chunk.                                                                                                                                                                                    |
| <b>tidy</b>            | FALSE         | If TRUE, knitr will tidy code chunks for display with the <code>tidy_source()</code> function in the <code>formatR</code> package.                                                                                                                                              |

## Syntax for slide formats (ioslides, slidy, beamer)

# Dividing slides 1

Pandoc will start a new slide at each first level header

## Header 2

... as well as each second level header

\*\*\*

You can start a new slide with a horizontal rule '\*\*\*' if you do not want a header.

## Bullets

Render bullets with

- a dash
- another dash

## Incremental bullets

- >- Use this format
- >- to have bullets appear
- >- one at a time (incrementally)

becomes

## Slide display modes

Press a key below during presentation to enter display mode. Press `esc` to exit display mode.

### ioslides

- f** - enable fullscreen mode
- w** - toggle widescreen mode
- o** - enable overview mode
- h** - enable code highlight mode
- p** - show presenter notes

### slidy

- C** - show table of contents
- F** - toggle display of the footer
- A** - toggle display of current vs all slides
- S** - make fonts smaller
- B** - make fonts bigger
